DPUTRFSGE

Performs the visualization of traffic participants. The graphical objects are inserted in SILAB's 3D world, which is managed by DPUSGEWorld.

1. Dynamic parameters:

ShowWheelDistance	Distance [m] up to which the vehicles' wheels are visible. Should be matched with the display resolution. Default: 500
AnimationTriggerDistance	Distance [m] up to which the vehicles are animated in every simulation step. To improve system performance, animation is reduced when they are further away. Default: 100
MaxSGEInsert	???
ShowDelay	???

2. Static parameters:

SimCarName	Resource name of the SGE object that is used for the EGO vehicle. A graphical object to which the Car animation is assigned must be used. Default: cars.GolfII.blau
SimCarShow	Boolean flag, which allows to show the EGO vehicle, too. By default, it is hidden (false); to show it, set the parameter to true.
SimCarTName	Resource name of the SGE object that is used for the trailer. A graphical object to which the Car animation is assigned must be used. Default: cars.GolfII.blau
SimCarTShow	Boolean flag, which allows to show the trailer of the EGO vehicle, too. By default, it is hidden (*false*); to show it, set the parameter to true.
SimCarName2	Second Resource name of the SGE object that is used for the EGO vehicle (like only blue flashing lights for emergency car). A graphical object to which the Car animation is assigned must be used. Default: -
SimCarShow2	Boolean flag, which allows to show the second object of the EGO vehicle, too. By default, it is hidden (*false*); to show it, set the parameter to true.

3. Outputs:

NRoadUser	Number of existing vehicles in the traffic simulation.

4. Dependencies to other DPUs:

SILAB's traffic simulation consists of the DPUs DPUTRFX, DPUTRFClient and DPUTRFSGE.

Their dependencies are detailed in the following table:

DPU	Requires
DPUTRFX	DPUSCNX
DPUTRFClient	DPUSCNX + Connection to DPUTRFX
DPUTRFSGE	DPUTRFX / DPUTRFClient and DPUSGEWorld

For each dependency, please make sure that the dependent DPU's *Index* value is higher than the Index value of its dependencies.

5. Functional principle:

DPUTRFSGE inserts the traffic participants that are currently active into the SGE 3D world and animates them. The visualization of the roads and the environment is provided by DPUSCNXSGE.
