

DPUDelayLine

Delay of input signal.

1. Inputs:

<i>In</i>	Input signal
<i>Delay</i>	Current delay in milliseconds

2. Parameters:

<i>DelayMax</i>	Maximum delay in milliseconds. <i>DelayMax</i> must be greater than <i>Delay</i> , at least the number of milliseconds of the simulation cycle.
-----------------	---

3. Outputs:

<i>Out</i>	Signal output (delayed input signal).
------------	---------------------------------------

4. Functional principle:

The *DPUDelayLine* defers the input signal by the time *Delay*. Maximum delay is *DelayMax*. Delay time *Delay* has been rounded to a multiple of the simulation cycle.

5. Example:

```
DPUDelayLine JanDelay
{
    Computer = { LOCALHOST };
    Index = 101;

    DelayMax = 100;    # max 10 steps at 100 Hz simulation
    Delay = 50;        # using 5 steps delay
                        # may be changed during simulation time
};
```
