

DPUFiltSimple

Filters input values with a simple digital filter implemented as exponential, weighted moving average. In addition, a digital filter of order k with arbitrary filter coefficients can be realized.

1. Inputs:

In Input to be filtered

2. Dynamic parameters:

k Factor for exponentially averaged values

Order Order of user defined filter

a[1..Order] Filter coefficients

b[1..Order] Filter coefficients

3. Outputs:

OutSimple EMWA, exponential moving weighted average

$OutSimple[i] = In[i] * k + OutSimple[i-1] * (1-k)$

Out Output of user defined filter with filter coefficients a and b.
