

DPUKeyboardEvent

Keyboard query for marking events.

1. Inputs:

<i>HoldTime</i>	Duration during which the current value of Key remains set. Afterwards the default value is set again.
<i>HoldTimeNumPad</i>	Duration during which the current value of NumPad re-mains set. Afterwards the default value is set again.
<i>DefaultValue</i>	Value of Key, which is displayed if no button is pressed
<i>DefaultValueNumPad</i>	Value of NumPad, which is displayed if no button is pressed
<i>Mode</i>	= 0: Value is applied just temporarily (HoldTime) = 1: Value is applied permanently
<i>NumPadMode</i>	= 0: Value is applied just temporarily (HoldTimeNumPad) = 1: Value is applied permanently

2. Outputs:

<i>Event</i>	Permanent key value
<i>Key</i>	Temporary or permanent key value
<i>NumPad</i>	Temporay or permanent key value (NumPad)
<i>KeyTime</i>	Elapsed time since start of simulation or since last key press
<i>NumPadTime</i>	Elapsed time since start of simulation or since last key press (NumPad)

3. Functional principle:

1simulation, with numbers. To do so, on the computer on which this DPU runs, keys are pressed, which are converted to event numbers. The applications SILAB (if key presses on the operator computer shall be queried) respectively SILABRemote (que-ry on remote computer) need to have the input focus to be able to determine the pressed key.

The outputs Event and Key are coded as following:

Numbers:

Key	Event/Key
0	0
1	1
2	2
3	3
4	4
5	5
6	6
7	7

SILAB DRIVING SIMULATION

version Version 7.1 documentation

8	8
9	9

Others:

Key	Event/Key
-----	-----------

Function keys:

Key	Event/Key
F1	1
F2	2
F3	3
F4	4
F5	5
F6	6
F7	7
F8	8
F9	9
F10	10
F11	11
F12	12
Backspace	0

The output *NumPad* is coded as following:

Key	Num/Pad
0	0
1	1
2	2
3	3
4	4
5	5
6	6
7	7
8	8
9	9
,	10
/	11
*	12
-	13
+	14

Event holds – in contradiction to Key and NumPad – the last value. In case that no key is pressed the default value of Key/NumPad and the maximum duration during which the key value is output, can be set and modified during run time.
