

DPUMessage

This DPU displays a message (either as warning or error) on Launch step and can also be used to write messages periodically to the SILAB log window during the simulation.

1. Inputs:

Text Message string to display

2. Dynamic parameters:

TriggerFlag Display the text periodically? Default: false

PeriodMS Time in milliseconds to wait between two text outputs

3. Static parameters:

ErrorFlag Should the text on Launch show up as an error message and interrupt the Start (true) or only show a warning message (false, default) if *TriggerFlag* isn't set to true?

4. Outputs:

LastMessageTime Timestamp (simulation time) of the last message written to the log window

5. Example:

This DPU works well using the following script:

```
DPUMessage myMessage
{
  Computer = {OPERATOR};
  Index = 10;
  Text = "Hello, world!"
};
```
