

DPUSGECompressTextures

Loads all graphical objects, signs and background panoramas (one at a time) into the visualization SGE and compresses their textures.

This operation ensures that all future SILAB configurations do not need to compress textures and thus can be started more quickly.

1. Inputs:

<i>WaitTimeMS</i>	Waiting time (ms) between every two objects loaded. Default: 100 ms
-------------------	--

2. Outputs:

<i>NumObjectsTotal</i>	Total number of objects that can be loaded
<i>NumObjectsProcessed</i>	Number of objects that have already been loaded
<i>Progress</i>	Current progress (percent)
<i>CurrentObject</i>	Name of the currently processed object

3. Dependencies to other DPUs:

DPUSGECompressTextures depends on **DPUSGEWorld**, **DPUSGEView** and **DPUSCNXSGE**. The *Index* value of **DPUSGECompressTextures** must be higher than the one of **DPUSGEWorld** and **DPUSCNXSGE**, but lower than the one of **DPUSGEView**.

4. Functional principle:

Because some additional configuration of the visualization is required, the DPU should only be used with the script file

`(D:\SILAB\Projects\CompressTextures\CompressTextures.cfg`

which is included in SILAB's scope of delivery.
