

## DPUSystemTime

DPUSystemTime makes the local system time available as output so it can be used by other DPUs.

### 1. Outputs:

|                 |                                                                                                                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>hour</i>     | hour of the day                                                                                                                                                                            |
| <i>minute</i>   | minutes                                                                                                                                                                                    |
| <i>second</i>   | seconds                                                                                                                                                                                    |
| <i>unixtime</i> | seconds since 1.1.1970 00:00:00 (unix time).<br>Fractional values are included, but the actual precision varies depending on the operating system and the setting of the computer's clock. |
| <i>clock</i>    | string in the format „hh:mm“                                                                                                                                                               |

### 2. Dependencies:

The PC's system time is accessed (might not be the actual/correct time).
