

DPUTransform

1. Inputs:

$[X,Y,Z]_{In}$	Input coordinate
$[X,Y,Z]_{Offset}$	Offset coordinate
$[RX,RY,RZ]_{In}$	Rotation alongside the axis in rad
$[RX,RY,RZ]_{Offset}$	Offset coordinate of rotation
$[TX,TY,TZ]_{In}$	Translation vector

2. Outputs:

$[X,Y,Z]_{Out}$	Result of computation
-----------------	-----------------------

3. Functional principle:

The DPU transforms and rotates the coordinates corresponding to the order of computations of the SILAB coordinate transformation.
